

# Translating the IM behaviour of munitions to operational consequences

Peter Hooijmeijer, Gert Scholtes, Martijn van der Voort

## Overview

- › Introduction
  
- › Case study in compound
  - › Mortar attack at compound
  - › Detonation of ammunition storage
  
- › Sympathetic Reaction toolbox
  - › Case study: M107 155 mm
  - › Research mitigating materials
  
- › Conclusions

## Introduction

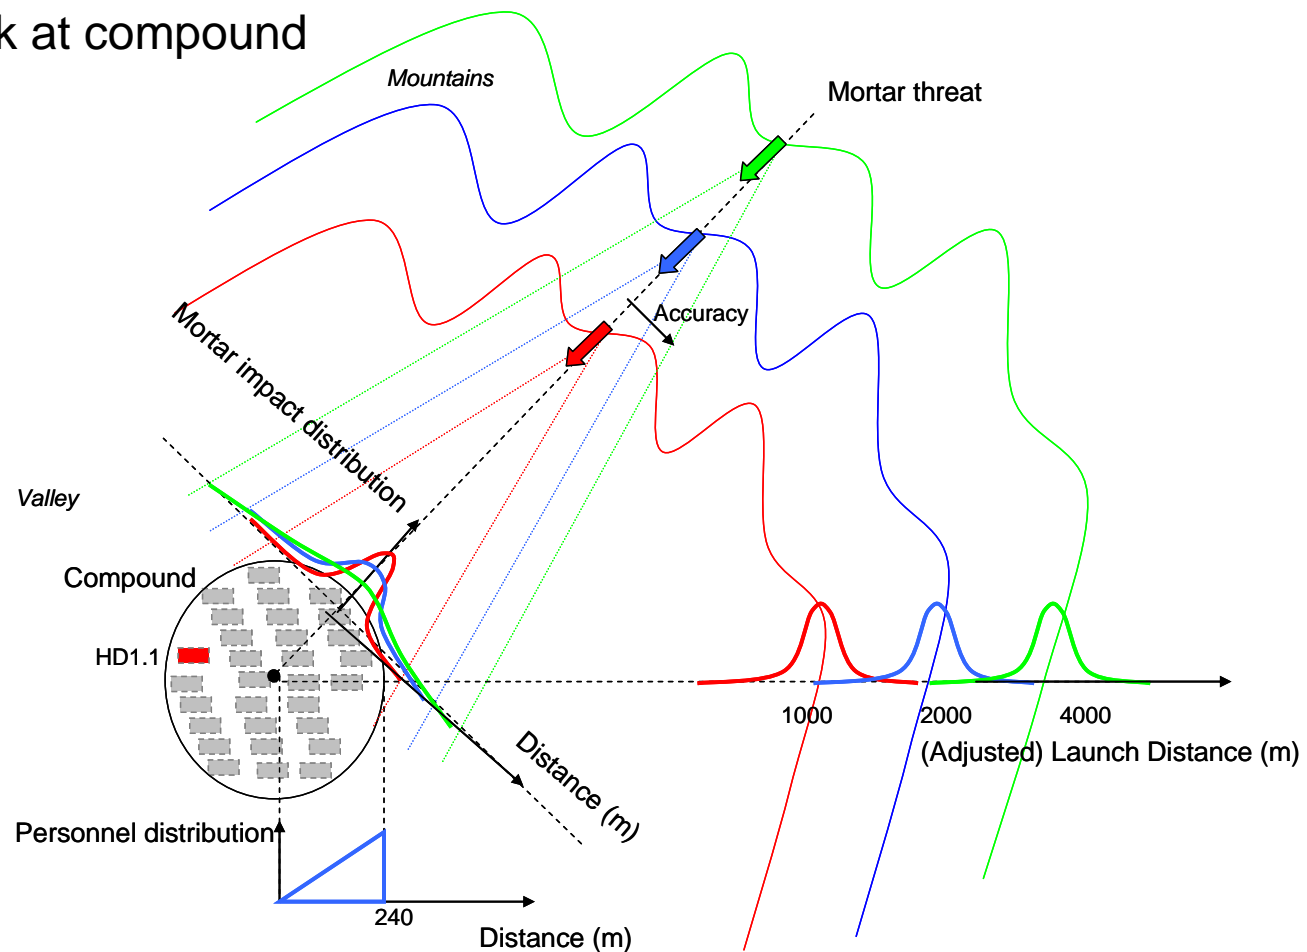

- › Protection and Survivability of Compounds
- › Countermeasures
  - › Situational Awareness
  - › Concealment /Camouflage
  - › Distance
  - › Physical protection
    - › Munition storage

# Case study

## › Mortar attack at compound

## Case study

- › Domino scenario: detonation of ammunition storage (0.5 %)
- › Entire storage (4000 kg) versus just one pallet (56 kg)
- › Setting the stage for R&D in the field of IM munitions
- › This is what it's all about!

## Overview

- › Introduction
  
- › Case study in compound
  - › Mortar attack at compound
  - › Detonation of ammunition storage
  
- › **Sympathetic Reaction toolbox**
  - › **Case study: M107 155 mm**
  - › **Research mitigating materials**
  
- › Conclusions

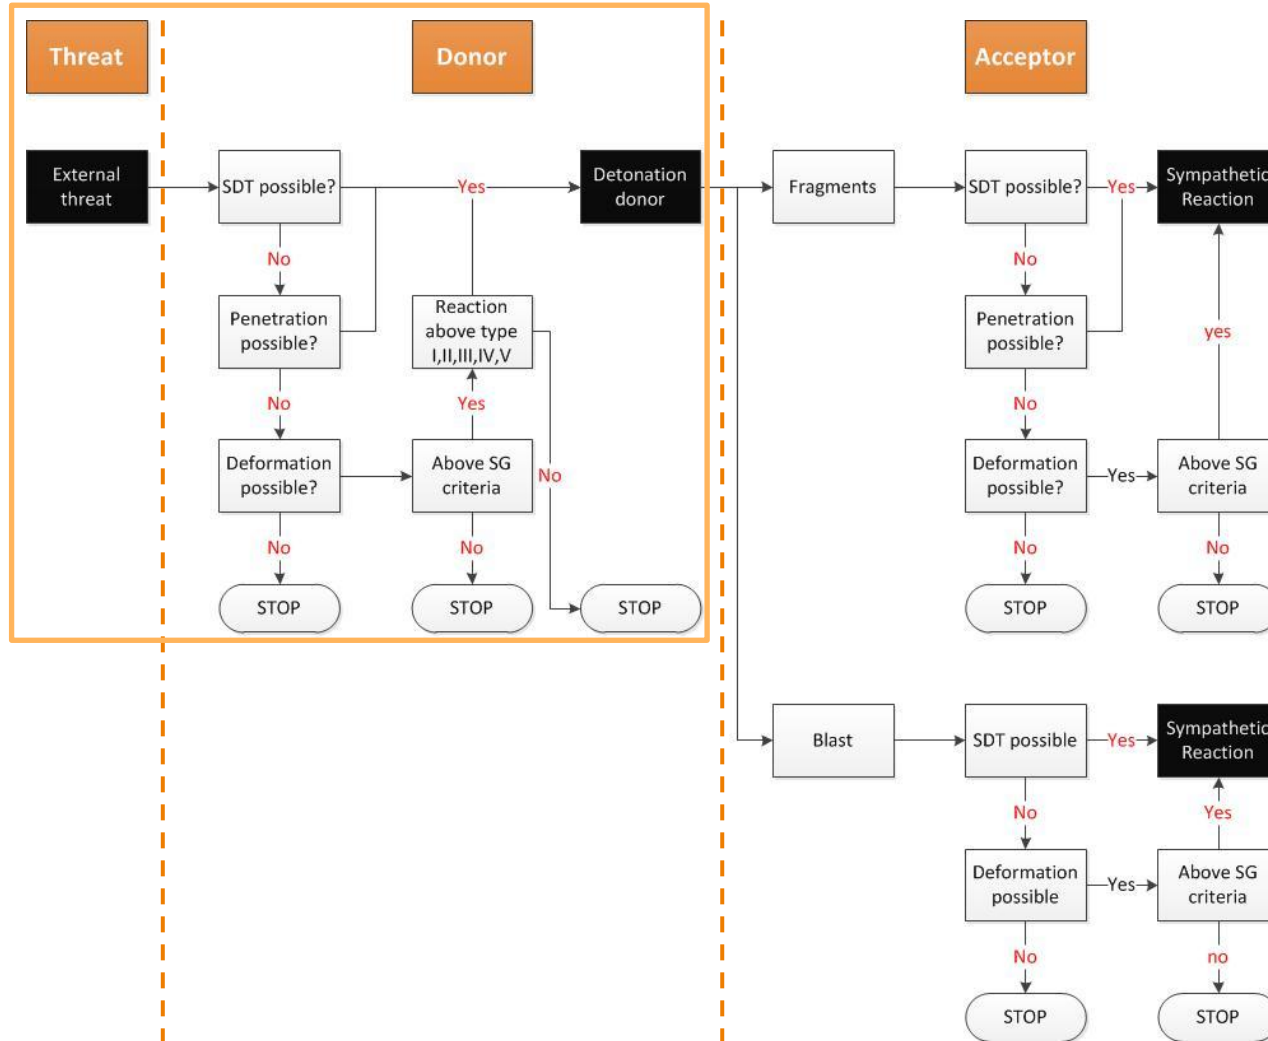

# Sympathetic detonation Toolbox

- › Effects external threat
- › Effects detonating article on neighbouring articles
- › Engineering tools
- › Spreadsheet implementation

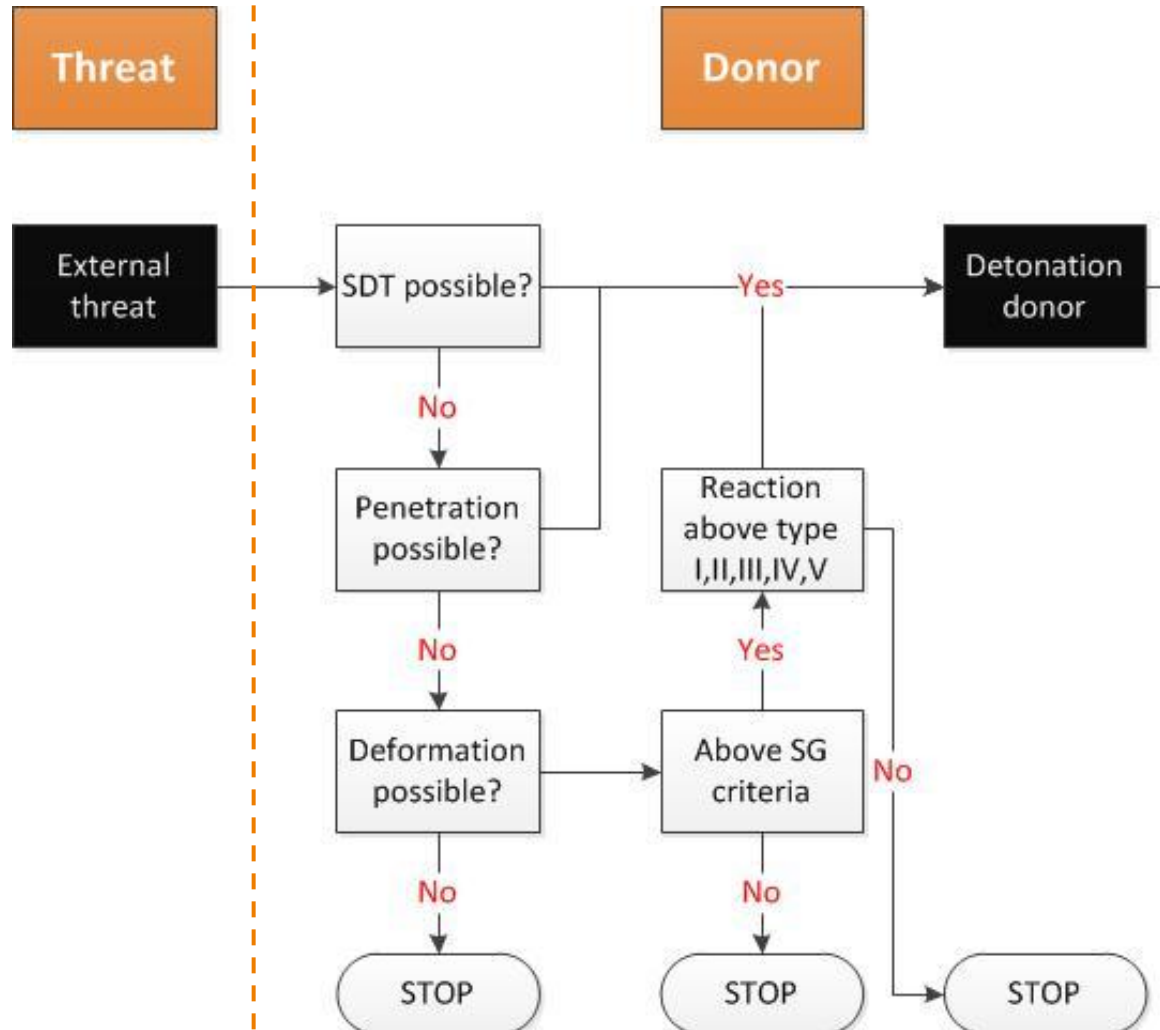

# Outline Toolbox

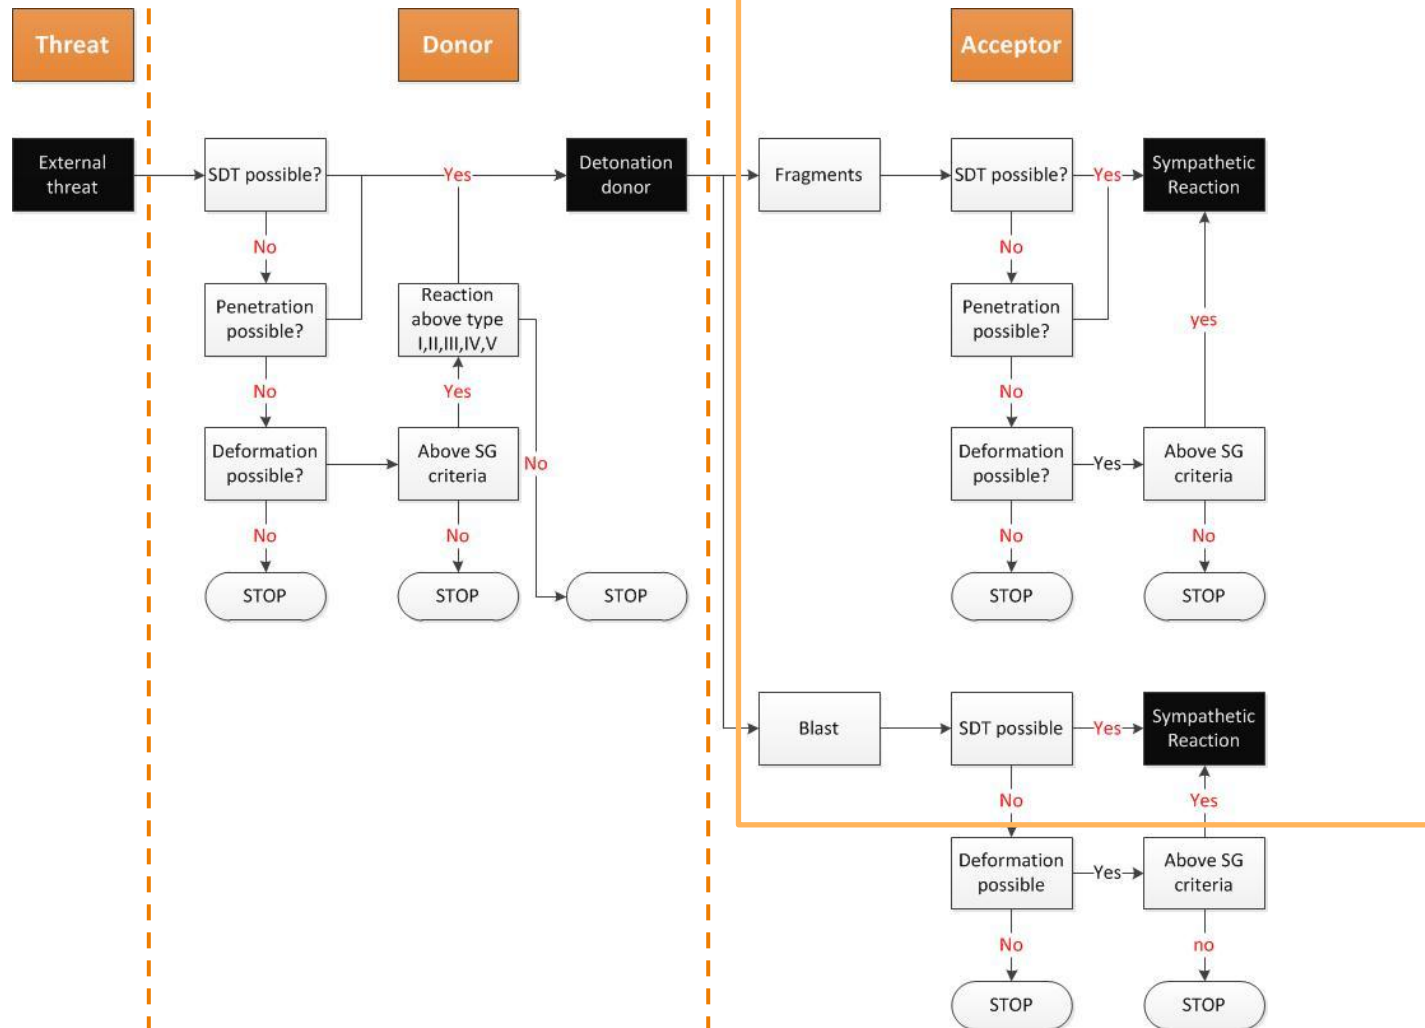

## Outline Toolbox

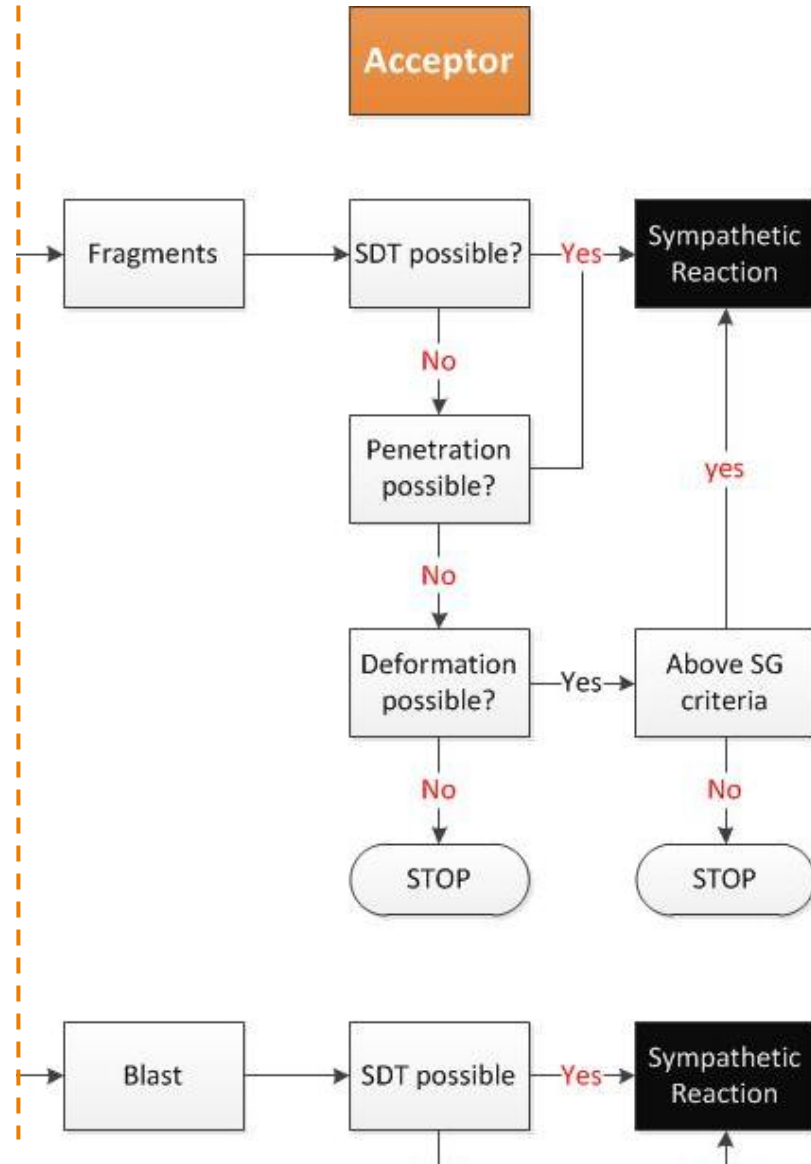

# Outline Toolbox

# Outline Toolbox

## Case study: Sympathetic detonation M107, 155 mm

- › Threat: effects from incoming mortar
- › Donor and Acceptor: M107, 155 mm, TNT filled

- › Three Mechanisms:
  - I. Acceptor in neighboring stack (10-100 cm's)
  - II. Acceptor in same stack: one-on-one
  - III. Acceptor in same stack: diagonal positioned

## Three mechanisms

› Effects on acceptors vary with distance

20 mm distance

40 mm distance

70 mm distance

## Conversion to representative cylinder

Dimension		Type	
		CompB	TNT
Mass metal part	kg	35,0	35,0
Design explosive mass	kg	8,41	8,39
Total mass	kg	43,41	43,39
External diameter	mm	155,0	155,0
Internal diameter	mm	112,3	113,2
Thickness casing	mm	21,35	20,90
Length	mm	494,0	509,0

Mott fragment  
distribution equations

Parameter		Type	
		CompB	TNT
Mott constant	$\text{kg}^{0.5} \text{m}^{-7/6}$	2,714	3,815
Fragment distribution factor	$\text{kg}^{0.5}$	2,00	2,75
Average fragment mass	gr	7,89	15,16
Heaviest fragment	gr	280	455
Design fragment mass	gr	36	68
Total number of fragments	-	658	346

## Results evaluation

### › Summary of results

Mechanism	Relevant threat	Result
I	SDT	Highly likely for different fragments and impact angles
	Acceptor casing penetration	Highly likely for different fragments shapes and impact angles
	Blast	Critical shock pressure of the explosive fill exceeded < 2 m
II	Sympathetic reaction, one-on-one (homogeneous loading of acceptor)	No SDT, effect of deformation not evaluated
III	Sympathetic reaction, diagonal (homogeneous loading of acceptor)	SDT is highly likely

- › Results of the Toolbox evaluation guides the search for the right mitigating materials or structural solutions

## Approach for barrier research

- › A barrier should:
  - › Stop Fragments
  - › Stop Secondary fragments (e.g. spall of container)
  - › Reduce (Blast) pressure
  - › No secondary fragments from barrier itself
  - › Reduce deformation acceptor

Pumice

Anti Fracticide bars

## Approach for barrier research – recent advances

- › New blast mitigating materials for situation of SD
  - › Based on damage assessment of acceptor
  - › Homogeneous load distribution due to intact casing
- › Tested materials (a.o.)
  - › Aluminium foam
  - › Polyurethane foam

## Experimental set up

- › Experiment in bunker
- › 1 donor, 2 acceptors at different distances
- › Steel cylinders  $D=70$  mm,  $t=5$  mm
- › Semtex10 or sand fill

## Results

› 20 mm distance

No mitigation

PUR foam

## Results

› 40 mm distance

No mitigation

PUR foam

## Results

› 70 mm distance

No mitigation

PUR foam

## Results

- › All materials excellent fragment arresting capabilities
- › PUR and Al foam applied
  - › Live acceptors
  - › Autodyn simulations

	Distance [mm]		
Material	20	40	70
PUR foam	n.t.		
Aluminium foam	n.t.		n.t.

## Results

- › Simulation of foam behaviour - movie

## Conclusions

- › Engineering tools in the sympathetic detonation Toolbox guide the search for the right mitigating materials or structural solutions
- › Important difference between effects mass detonation or limited event
  - › Quantification of consequences

Putting all the work on IM munitions in the right perspective sets the stage and motivates and challenges research engineers in their activities. These efforts protect the war fighter in an intrinsic dangerous environment.
